Notes on the Harvest

After five months of almost ideal weather conditions, the farmers in this district see the greater part of an excellent crop in the stock and practically safe. The ground was in splendid condition for germination in the fall. Rainy intervals during the growing season, was only one time when drought seemed to have for a few days checked the growth. And now ideal harvest weather and no serious lack of help. The binders are running in the fields. Fifty percent of the wheat and barley is in stock.

Next week the farmers will be interested upon the farmer that has prepared of the land, a careful selection of seed, makes a sure harvest. There was once grain sown on summerfall than ever before in this district and it is this grain that is delighting the heart of the farmer. Grain drilled with the grain on the fallow, if a poor farmer will not pay expenses this year when everything has been so favorable, what chance is there in a bad year?

No frost in this district means that the buyers will have no excuse to demand a good sample by seeing imaginary traces of frostbite. So the binders and threshing outfit men take care by the coming fall that there ought to be more money from this crop, for other creditors of the farmer. Last fall all the money there was annexed by the implement companies.

The wheat berry this year is the plumpest that has been seen in this district. In fact so well nourished is the wheat that they sell very readily in the hand.

The shortage of men has not become acute but more are needed in this district. The same old holdout is being tried by the harvester. Some prefer to sit idle around the shady side of the buildings waiting for a skilled mechanician to pay for a laborer's job.

There will be a large number of 40 bu. crops this year and 30 will be a fair average around here. No 1 Hard will not be uncommon.

All the grain is ripening together in this district. Never before have the fields of different grains taken the fields of which they wanted to be harvested at the same time.

The abnormal seasons seen to have passed and Southern Alberta is back where it belonged. Prosperity is here after a brief hibernation some where.

How They Suffer

An exchange remarks: "The numerous reports and editorials these days on the financial stringency is sure proof that every newspaper is up against it." There are several reasons why it could not be otherwise. To begin with, a very large majority of our Alberta towns, where newspapers exist, are struggling to find a medium to warrant the establishing of a paper. The party jealousies existing between neighboring towns, makes it impossible for one paper to serve a reasonable district, because business men will not give patronage to a paper published anywhere except in their own hamlet. They will leave a store in one town and go to another town started and wear the very best brains and equipment in the land, but when a money stringency arises the editor and printer is one of the first to suffer. Advertising is carelessly or cut out altogether, soap wrappers or something as cheap are substituted for a properly printed sheet, and if it is necessary enough to pay the actual running expenses. And yet, what agency has done more to build up the town and assist its business men to success? Daysland Press.

Water Cure For Idlers

The citizens of the town of Brady, near Great Falls, Mont., angered by the persistent refusal of tramps to go to work, although harvest hands were badly needed, tried the water cure for that complaint, ducking them in the water trough till each consented to go to work. Every night a vigilante committee openly ducked the idlers.

HOME COURSE IN FRUITS AND BERRIES

RASPBERRIES, CURRANTS
AND GOOSEBERRIES.

By LE. ROY CADY and K. A.
KIRKPATRICK of the Min-
nesota Agricultural College.

THIS raspberry will succeed on any good garden soil. It likes a great deal of moisture. A north slope is the best. The presence of a number of shrubs in the soil is a great hindrance to its growth.

The best fertilizer to use is stable manure comparatively free from straw or feed seed. Apply a fair amount of manure to the soil in the fall and plow under. If the ground is already quite rich, it is better to add a few bushels of straw or roots or potatoes previous to setting the plants or even to disperse with the manure altogether.

It is best to plant in the fall and allow full weathering. If plowing must be done in the spring the top portion of the soil should first be tilled with a disk or a spading harrow.

In the spring, when the plants are well established, a few bushels of straw or roots should be added to the soil. If the plants are to be dug, follow with a disk or spading harrow, working the soil to a depth of 6 to 8 inches.

It is best to plant in the fall and allow full weathering. If plowing must be done in the spring the top portion of the soil should first be tilled with a disk or a spading harrow.

The upright and spreading varieties may be set with good results in the fall. The black caps, or the tip growing sorts, should be planted in the spring, as they are more easily damaged by being dug.

Practically all raspberries are started from the tip plant.

The upright and spreading varieties may be set with good results in the fall. The black caps, or the tip growing sorts, should be planted in the spring, as they are more easily damaged by being dug.

Practically all raspberries are started from the tip plant.

Raspberry Propagation

Practically all raspberries are started from the tip plant.

Pruning

In large plantings the best plan is the check system. Use a single plant to establish a hill and plant 8 by 6 feet for best results. Where continuous plantings are used stand 8 by 4 by 6 feet.

Cultivation and Mulching.

The current man, or the man who has been raised, is the best man for the job. The necessary mulch must be maintained by continual surface cultivation or by mulching.

Manure, straw and manure are used for mulching. Hardwood ash, if not worked into the soil, is probably the best. Apply to a depth of 2 to 3 inches. A good mulch will keep a plant growing until the next mounding soil in and about them to a height of eight or ten inches.

Planting

In large plantings the best plan is the check system. Use a single plant to establish a hill and plant 8 by 6 feet for best results. Where continuous plantings are used stand 8 by 4 by 6 feet.

Cultivation and Mulching.

The current man, or the man who has been raised, is the best man for the job. The necessary mulch must be maintained by continual surface cultivation or by mulching.

Manure, straw and manure are used for mulching. Hardwood ash, if not worked into the soil, is probably the best. Apply to a depth of 2 to 3 inches. A good mulch will keep a plant growing until the next mounding soil in and about them to a height of eight or ten inches.

Pruning

The plants will probably produce the best fruit and the largest portion of the fruit in the two and three year old plants. After the first two years, the plants are allowed to grow four to eight main stems are allowed to develop, and a system of reducing the wood over three years old is adopted. This is the best method of pruning, as it keeps the plants from getting too tall and within the row, where the continuous row is cultivated.

Pruning

The plants will probably produce the best fruit and the largest portion of the fruit in the two and three year old plants. After the first two years, the plants are allowed to grow four to eight main stems are allowed to develop, and a system of reducing the wood over three years old is adopted. This is the best method of pruning, as it keeps the plants from getting too tall and within the row, where the continuous row is cultivated.

Pruning

If the tip plants the tips of the branches are cut back to the ground in the spring, the plants will grow well and bear well in the fall. If the soil is loose and extremely dry they should have earth placed around the base of the plants to keep them from getting too tall and within the row, where the continuous row is cultivated.

Pruning

If the tip plants the tips of the branches are cut back to the ground in the spring, the plants will grow well and bear well in the fall. If the soil is loose and extremely dry they should have earth placed around the base of the plants to keep them from getting too tall and within the row, where the continuous row is cultivated.

Laying them down in winter is always saving labour.

Varities should be limited. Rets and diseases are usually not present, or they are rarely controlled.

Currants.

The currant must have a moist, cool soil. The best results are obtained on a strong clay loam or even on a stiff clay. It is in a good state of cultivation. A currant should be planted and comparative low, moist ground, with some shade, will often be most desirable. Planting among orchard trees is a good idea.

A close space will furnish sufficient fruit for the ordinary family. They should not be set out along fence rows, as they will not bear well.

The plants are grown from cuttings of the ripened wood in August or September after the leaves have fallen. They are set out in rows of three, four inches apart, and are planted in well prepared garden soil, with only an inch above ground, four inches apart. The plants should be set out in the winter, as the winter growth will have started, and in the spring they will grow and grow strongly. They should be set out in the fall, as the growing season to come the moisture. They are sometimes planted when one year old, but the best results will be obtained by allowing the plants to grow for two seasons before setting.

The currant may be rooted by breaking off a portion of the stem with a sharp knife, dipping the tip in soil, leaving the tips exposed. After one season they should cut loose, and grow in and around the base of the plant, and then plant out.

They are also layered successfully by cutting off a portion of the stem, one year old, and then covering the stem with moist soil and about them to a height of eight or ten inches.

Planting

The best plan is the check system. Use a single plant to establish a hill and plant 8 by 6 feet for best results. Where continuous plantings are used stand 8 by 4 by 6 feet.

Cultivation and Mulching.

The current man, or the man who has been raised, is the best man for the job. The necessary mulch must be maintained by continual surface cultivation or by mulching.

The plants will probably produce the best fruit and the largest portion of the fruit in the two and three year old plants. After the first two years, the plants are allowed to grow four to eight main stems are allowed to develop, and a system of reducing the wood over three years old is adopted. This is the best method of pruning, as it keeps the plants from getting too tall and within the row, where the continuous row is cultivated.

Pruning

A Modern Hero in War.

He Meets the Demands of Death and Life.

"Have you found the man who led the forlorn hope, the first man to scale the heights of death?"

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."

"He is here," said the general, "but he is not a general."
